

Repeat of grad_scatter, per schedule — 40 random points, $A \in [-2.86, 2.95]$, $B \in [-2.97, 2.96]$; $K = 7$ probes $f_x \in [-1.5, 1.5]$; no target: $\beta = 0.02$, $\varepsilon \equiv 1$
the numerical-adiabatic reference is itself contaminated, so both axes scatter
